

We (Hoekmine BV, a Dutch SME) are looking for a Danish SME in the micro engineering or microbiology area to complete a Eurostars consortium (Germany, France, DTU for Denmark). Do you have any companies in your network you feel to be suitable...? If so, a contact would be much appreciated.

Hoekmine BV and partners is building a new form of Petri dish using micro-engineering and microfluidics. It will create gradients in X and Y axis (think two different antibiotics for example, or nutrients). Therefore you can test a very large combination of conditions at once. We expect applications in ecology, strain improvement, fighting antibiotic resistance, toxicity, complex microbial processes such as gut microbiota health. We need a DK SME partner, possibly an end user or maybe some form of imaging or detection method. Project will be three years and currently includes French and German SMEs and a DK academic group (DTU).

Deadline is start of March.
